Retrospective Cohort Study

Total pancreatectomy and islet autotransplantation: A decade nationwide analysis

 Reza Fazl Alizadeh, Zhubin Moghadamyeghaneh, Aram N Demirjian, David K
 Imagawa, Clarence E Foster, Jonathan R Lakey, Michael J Stamos, Hirohito Ichii
Abstract
 AIM: To investigate outcomes and predictors of in-hospital morbidity and mortality
 after total pancreatectomy and islet autotransplantation.

Methods: The nationwide inpatient sample (NIS) database was used to identify patients who underwent total pancreatectomy (TP) and islet autotransplantation (IAT) between 2002-2012 in the United States. Variables of interest were inherent variables of NIS database which included demographic data (age, sex, and race), comorbidities (such as diabetes mellitus, hypertension, and deficiency anemia), and admission type (elective vs. non-elective). The primary endpoints were mortality and postoperative complications according to the ICD-9 diagnosis codes which were reported as the second to 25th diagnosis of patients in the database. Risk adjusted analysis was performed to investigate morbidity predictors.
