Blessing and a curse of outpatient management of delayed graft function

Blazel JW *et al.* Outpatient management of DGF

Justin W Blazel, Jennifer A Turk, Brenda L Muth, Sandesh Parajuli

Abstract

Delayed graft function (DGF) is a common complication occurring most often after deceased donor kidney transplant with several donor characteristics as well as immunologic factors that lead to its development post-transplant. These patients require dialysis and close kidney function monitoring until sufficient allograft function is achieved. This has resulted in limited options for DGF management, either prolonged hospitalization until graft function improves to the point where dialysis is no longer
