Pharmacogenetics as a tool to tailor antiretroviral therapy: A review

Antonio Aceti, Laura Gianserra, Lara Lambiase, Alfredo Pennica, Elisabetta Teti

Abstract

Highly Active Antiretroviral Therapy (HAART) has substantially changed HIV infection from an inexorably fatal condition into a chronic disease with a longer life expectancy. This means that HIV patients should receive antiretroviral drugs lifelong, and the problems concerning with a chronic treatment (tolerability, side effects, adherence to treatment) have now become dominant. In this context, strategies for the treatment personalization have taken a central role in optimizing the therapeutic response and prevention of adverse
