Ability of community-based prostate cancer screening to target an appropriate and underserved population

Jarrold Moss, Eric Heidel, Jason Johnson, Chase Powell, Erin Ditttrich, Susan Rawn, ¹Paul Terry, Mitchell Goldman, W Bedford Waters, Wesley M White

Abstract

Screening is not universally beneficial due to over- and under-diagnosis, and false positives that beget additional testing and associated adverse events and expense. We examined data from all men who participated in a mass community prostate cancer screening between May 2009 and September 2010. The data ¹contained information regarding patient demographics, family history of prostate cancer, lower urinary tract symptoms, prior history of prostate cancer, most recent DRE, and the presence of an established relationship with a physician. Current American Urological Association screening recommendations were then applied to determine the appropriateness of our outreach effort. A total of 438 men (mean age 66.5 years) underwent screening. A total of 106 (24.2%) patients in our study met contemporary criteria for screening. Of these men, the vast majority was well educated, well insured, and well informed about the need for prostate cancer screening. ¹Based on these data, mass community-based
