Laparoscopic surgery: A qualified systematic review

Alexander Buia, Florian Stockhausen, Ernst Hanisch

Abstract

AIM: To show an overview of the possibilities in laparoscopic surgery with highlighting the standard of laparoscopic procedures.

METHODS: A comprehensive search was undertaken using the PubMed Advanced Search Builder. 321 articles were found in this search. Publications were selected if they satisfied the inclusion criterias being review articles, randomised controlled trials and meta-analyses discussing the subject of laparoscopic surgery. In addition, publications were hand searched in the Cochrane database and in high impact journals. 82 of these findings were included matching the inclusion criterias. Overall there were 403 articles full text reviewed. 218 articles were excluded because of not matching the inclusion criterias.
