9

10 Abstract

11 AIM: To define footwear outcomes following hallux valgus surgery, focusing on patient return to  
12 comfortable and heeled footwear and patterns of post-operative footwear selection.

13

14 METHODS: Surgical intervention is indicated for symptomatic cases of hallux valgus  
15 unresponsive to conservative methods, with favourable reported outcomes. The return to various  
16 types of footwear post-operatively is reflective of the degree of correction achieved, and  
17 corresponds to patient satisfaction. Patients are expected to return to comfortable footwear post-  
18 operatively without significant residual symptoms. Many female patients will additionally  
19 attempt to return to high-heeled, narrow toe box shoes. However, minimal evidence exists to  
20 guide their expectations. 65 female hallux valgus patients that had undergone primary surgery  
21 between 2011 and 2013 were retrospectively identified using our hospital surgical database.  
22 Patients were reviewed using a footwear-specific outcome questionnaire at a mean 18.5 months  
23 follow-up.
