

Biostatistics Review Certificate

This is to certify that the statistical review of the study titled “Impaired implicit emotion regulation in patients with panic disorder: An ERP study on affect labeling” has been conducted by a qualified biomedical statistician. The biostatistical analysis included thorough examination and verification of the study's data, ensuring the accuracy and reliability of the statistical methods employed.

The statistical review encompassed various aspects, including but not limited to study design, sample size determination, data analysis, and interpretation of results. The analyses were performed using appropriate statistical techniques relevant to the study objectives, providing a robust foundation for the conclusions drawn.

This certificate affirms that the biostatistical assessment was executed in compliance with established standards and practices in the field. The results presented in the study are deemed to accurately reflect the statistical outcomes derived from the data analysis.

For any inquiries or additional information regarding the biostatistical review process, please contact the undersigned.
