Dear editor:

The figure below shows informed consent for endoscopy and interventional therapy in our hospital. The informed consent not only contains detailed information about the operation (e.g. purpose of examination, surgeon, diagnosis, operation name, possible complications), but also informs that the clinical data of patients might be used for medical and educational purposes, including being published. We translated the content marked in red into English:" Our hospital is an academic medical center that integrates medical care teaching and scientific research. Refresher doctors may participate in the operation. Trainee doctor are allowed to watch the course of procedure. The clinical data of the patients might be used for medical and educational purposes, including being published without disclosing patients' identities. The specimens taken during the operation might be sent for further scientific research." All guardians of the patients had given fully informed consent of above notification. In fact, the clinical data and figures shown in our manuscript avoided disclosing the identities of the patients.

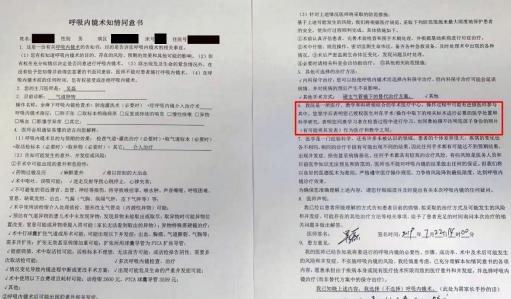

The present study was approved by the Ethics Committee of The Children's Hospital,

Zhejiang University School of Medicine (approval no. 2021-IRB-106).

If you have any queries, please don't hesitate to contact me at the address below. Thank you and best regards.

Yours sincerely,

Yingshuo Wang
