SPECIFIC COMMENTS TO AUTHORS

Pimelosis of the yellow marrow in the sacral wing of the elderly leads to greater bone loss in this area, whereas the sacrum has a relatively large amount of bone mass. In elderly patients with pelvic fractures, fracture lines are often found on the sacral wing, mainly in the type of lateral compression of incomplete fractures. This study investigated the application value of multi-slice spiral CT in the diagnosis of unstable pelvic fractures in elderly and the efficacy of minimally invasive internal fixation with hollow tension screws, in hopes of providing a valuable reference for clinical practice. The manuscript is very well written. After a minor revision, it can be accepted for publication. 1. The abstract is too long. Please short it. 2. There are some minor language polishing, which should be revised. 3. Please discuss the limit of the study.

SPECIFIC COMMENTS TO AUTHORS

This is an interesting study of the clinical value of multi-slice spiral computed tomography in diagnosing unstable pelvic fractures in elderly and effect of minimally invasive internal fixation. The study is very is well display, and the results are very well discussed. The reviewer suggests to accept this manuscript after a minor language editing.
