SPECIFIC COMMENTS TO AUTHORS

1. This is a very interesting report on PCA treated with fire needle. The two cases showed satisfactory outcomes by the application of fire needle. It provides a novel and effective option for PCA treatment. 2. Figure legends need further simplification. 3. Further discussion of the fire needle and dermatoscopy and dermatopathology features of PCA can be made in the discussion section. 4. UV should use the full name when it appeared the first time. 5. You must check the English of the article. There are syntactic and grammatical errors. 6. English editing is recommended.

SPECIFIC COMMENTS TO AUTHORS

This study is about a new technique was used in 2 cases of Primary cutaneous amyloidosis (PCA) which is a chronic metabolic skin disease that results in deposition of amyloid in the dermal papilla layer. This study proposed pre-treated by fire needle which is a new method and results are good. Well written English. Cases well presented and photos of patient and pathology are in good quality. Well discussed with other diseases and treatment modalities. Overall good case management and possible take attention of readers.
