SPECIFIC COMMENTS TO AUTHORS

Review Decision: Accept for Publication Sequential multidisciplinary minimally invasive therapeutic strategy for heart failure caused by complex tetralogy: A case report The case report details a 27-year-old woman with tetralogy of patent ductus arteriosus (PDA), mitral valve prolapse (MVP), atrial fibrillation (AF) and hyperthyroidism who presented with severe dyspnea. Overall, the paper is clearly written in a detailed manner that allows the reader to understand the treatment pathway and the condition of the patient. Further to this, the case report includes a follow-up of two years which details the symptoms of heart failure and an enlarged heart to have been reversed. This long follow-up is of particular interest to the reader. Mention of the patient's involvement in their own healthcare was noteworthy and welcome – avoidance of a scar being an important factor for her. The discussion is appropriate to the requirements of the paper/reader. The patient timeline was an interesting addition to the paper – and a practice that journals might consider for all future case reports. A small point, some of the formatting appears to be inconsistent. This is easily resolved once/if the paper is accepted for publication.

1. The 4 conditions, patent ductus arteriosus (PDA), mitral valve prolapse (MVP), atrial fibrillation (AF) and hyperthyroidism, do not often occur together, and so the word tetralogy SHOULD NOT be used to describe them. 2. The authors should present details of thyroid function tests (TSH, FT3, FT4), as well as intracardiac chamber pressures on echocardiography so that readers can understand severity of the diseases.
