SPECIFIC COMMENTS TO AUTHORS

This paper is interesting because it was possible to diagnose gastric SMT due to a foreign body preoperatively and to perform endoscopic resection. The image is beautiful and worthy of evaluation.

SPECIFIC COMMENTS TO AUTHORS

I am glad to review this interesting article. This was a case report showing successful endoscopic removal of an embedded fishbone in the stomach. The manuscript was well written. There is one comment on this manuscript. #1 Recently, there was a case report of successful endoscopic removal of an embedded foreign body in the stomach by a technique of endoscopic submucosal dissection. Endoscopic techniques such as ESD and EFTR could be useful for the removal of the embedded foreign bodies in the gastrointestinal tracts. Please discuss this point in the manuscript. Carvalho AC, Pires F, Araújo R. Removal of an embedded foreign body in the stomach by a technique of endoscopic submucosal dissection. Dig Endosc. 2021 Sep 23. doi: 10.1111/den.14132. Epub ahead of print. PMID: 34555869.

SPECIFIC COMMENTS TO AUTHORS

General: In this case report, the authors showed case with gastric submucosal lesion caused by embedded fishbone and treated by endoscopic full-thickness resection. This case report was well written. Major comments: 1. Why did authors resect this lesion by endoscopic full-thickness resection, not surgery or ESD? 2. What is low-echoic lesion around bone in EUS? Inflammation? Edema? 3. A 47-year-old female, presented with upper abdominal discomfort for one year. How about abdominal symptom after resection? 4. What is the small whitish elevation of SMT? 5. As you mentioned, the mistaken consumption of fishbone lead to gastric submucosal lesion is a rare condition. Authors should focus this. 6. Authors should summarize previous cases with gastric submucosal lesion caused by foreign body. 7. What was the CT diagnosis? Fish bone seems to be diagnosable by CT (Figure 1C).
