SPECIFIC COMMENTS TO AUTHORS

this an interesting case report and good literature review of a rare CNS tumour IMT. the study highlights the importance of imaging and treatment modality of such tumour, and as it is mimic other intracranial lesion additional immunohistochemical analysis are needed preoperatively and continued post operative imaging and treatment is also needed. the study high lights that higher recurrence rate of IMT in relation to expression of ALK protein a receptor tyrosine kinase gene, an assessment that is proposed to be done to assess risk of recurrence after surgery. As this is a rare tumour in CNS, the study does summarise the available date so far, the presentation, treatment strategy, diagnosis and risk of recurrence. the study indicate that IMT have a high recurrence compared to other intracranial tumour, long term follow up investigation is required. My comments are in the abstract section there are repeat of sentence and suggest instead of conclusion change to discussion as suddenly change from a case study to a summary of literature. in the introduction described studying 100 cases but then only 49 cases is what is mentioned? at imaging described a left middle cranial fossa mass at surgery tumour is located at the base of anterior cranial fossa? Age range of disease mentioned some time 3 months but then 8 months what does is it mean comprehensive treatment compared to complete resection? there are repeated section in epidemiology with previous section. need improvement of article language,
