SPECIFIC COMMENTS TO AUTHORS

Hyperphosphatemia is one of the common complications during treatment, which is related to renal dysfunction and endocrine changes. It has been found that the lack of knowledge about hyperphosphatemia in hemodialysis patients with chronic renal failure is an important factor affecting their rational diet and medication according to doctor's advice, which directly causes the continuous increase of blood phosphorus level. At present, the health education for patients is mostly dominated by nursing staff. Communication and interaction between doctors and patients is limited and the content of health education may be poorly remembered. In this study, the authors observed the effect of doctor-led intensive diet education on health-related quality of life in patients with chronic renal failure and hyperphosphatemia. The study design is good. The methods are described in detail, and the results are very interesting. The reviewer found that there is some minor language polishing should be revised. The table 1 should be re-arranged. In the note of the table 3, there are explains of "*" and "#", but the symbols can't be found in the table.

SPECIFIC COMMENTS TO AUTHORS

This is an interesting study of a diet education and quality of life in chronic renal failure and hyperphosphatemia patients. The manuscript is very well written. Only the tables should be checked and edited.
