SPECIFIC COMMENTS TO AUTHORS

This is a nicely written manuscript, however it has a couple of issues that need to be addressed. 1. Why did the authors measure IgG4 serum levels? What findings lead them to that. 2. In its current form, the manuscript adds little to what is already known and has been previously described. I would suggest to add or discuss which specific findings lead to suspect the diagnosis. What imaging, clinical and para-clinical characteristics the clinician should be aware of, in order to suspect the disease.

SPECIFIC COMMENTS TO AUTHORS

This perfectly illustrated with high quality radiological and histopathological images LgG4-RKD case will be interesting for the WJCC readers as an example of fast and accurate IgG4-RKD diagnosis followed by successful treatment. To make this article even more useful for the medical community I would reccomend strengthening the discussion section. Authors may perform more comprehensive positive/negative experience of other clinicians in diagnosis and treatment of rare cases of IgG4-RKD presentation, and make beneficial practical recommendations. It would be also useful to look over existing reviews on IgG4-RKD topic and express authors' opinion or suggestions.
