SPECIFIC COMMENTS TO AUTHORS

This is an interesting study of relevant detection indicator of prethrombotic state in patients with primary hypertension. The manuscript is well written. Minor comments: 1. Some minor language polishing should be revised. 2. The methods and results in the abstract is too long. The authors should short these sections. 3. The images should be updated. The resolution ratio of the images seems not so good.

SPECIFIC COMMENTS TO AUTHORS

In this study, the authors analyzed the differences in these indicators of prethrombotic state in patients with PH from different patient populations to provide a laboratory basis for the clinical prevention and control of the occurrence and development of hypertensive thrombotic diseases. The study is well performed and the findings are interesting. The reviewer recommends to accept this manuscript after a minor editing. Thank you.
