COMMENTS TO AUTHORS

The enclosed images do not specify the projection view. The size of saccular aneurysm across fistula line is slightly more than the size of left main, such a small fistula are commonly being seen. The drainage site is not clear in both echo and angiography. A TEE could have track the distal site of fistulous drainage. An oxymetry run could have helped to assess the quantification of shunt and also the site of drainage, which was not performed. Asymptomatic fistula in index case with TMT negative, does not require any treatment. No MSCT or SPECT was performed to clearly delineate the course of fistula and its significance.

COMMENTS TO AUTHORS

This is a nice and interesting case. I miss a Cardiac CT for the very 3D assessment of the anatomy.

COMMENTS TO AUTHORS

Although current case seems to be somewhat interesting I believe that it does not improve the usual management policy of the patients presented with coronary artery fistula.

COMMENTS TO AUTHORS

I would recommended the authors review the submission and ask help of a english native speaker with grammar and spelling of their manuscript. Although interesting there is limited information given how this problem was treated in this patient and the follow up.

COMMENTS TO AUTHORS

This is a well-written clinical case describing a patient with several coronary fistulas associated to coronary aneurisms.
