COMMENTS TO AUTHORS

This minireview article describes the biological mechanisms that govern the crosstalk between ovarian cancer and its microenvironment, focusing in particular on endothelial cells, fibroblasts and macrophages. In addition, the authors outline the therapeutic strategies that have been (or are being) developed to specifically interfere with such a crosstalk. This is a timely review addressing a highly relevant question, which should be of interest not only to basic and translational scientists, but also to gynecological oncologists. In spite of its conciseness, the article provides a suitable overview from both the biological and the clinical standpoints, enabling the reader to get the picture of the hot questions and of the strategies to address them. Finally, the reader is referred to the most relevant literature in order to gain deeper knowledge on specific aspects of the field.

COMMENTS TO AUTHORS

This is an interesting review about targeted therapy in ovarian cancer.
