COMMENTS TO AUTHORS

Interesting case but it is difficult to diagnose actinic prurigo without typical skin manifestations. Have other differential diagnoses been ruled out? What about direct immunofluorescence and exclusion of oral pemphigus? Serum indirect immunofluorescence and desmogleins - have they been performed? What about TCR gene rearrangement for the lymphoid follicles - are the lymphoid follicular infiltrations reactive or neoplastic? Histological descriptions in both cases are not clear and detailed, and important positive and negative findings were not discussed. Besides, in such situation, phototesting can yield important photobiological information, and also together with HLA typing especially looking out for HLADRB1\*0407 and other HLA markers indicative of actinic prurigo in Brazilian population would be helpful too. Needs significant English polishing.
