## COMMENTS TO AUTHORS

Manuscript No 19406 Title: Contrast induced neurotoxicity following coronary angiogram with Iohexol in an end stage renal disease patient The above mentioned manuscript needs some minor corrections before its publication. 1. Key words should be written in an alphabetical order 2. Should write 'diabetes mellitus type 2' instead of 'diabetes mellitus 2' 3. Please write names of drugs lorazepam and levetiracetam with lower case alphabet 4. Mention full form of MRI where used first 5. Remove upper case alphabets from "fluid attenuated inversion recovery" 6. In a paragraph above discussion, "No definite restricted diffusion.. is an incomplete sentence. 7. Please rewrite discussion using small comprehensive sentences. Long and lengthy sentences are making it difficult to understand and comprehend the text 8. Check spelling of contrast in the second last para 9. Please mark the manuscript with page numbers.

## COMMENTS TO AUTHORS

Very good case report about contrast induced neurotoxicity. It is very well written, summarized but complete.

## COMMENTS TO AUTHORS

This case report presents contrast induced neurotoxicity following coronary angiogram with Iohexol in an end stage renal disease patient. The case report may remind interventionalists of being aware of contrast induced neurotoxicity in their future clinical works. I have minor comments as follows: 1. Could authors provide the accurate administration times for iodinated contrast agents including Visipatue 320 and Omnipaque 350, and the accurate times of imaging examinations including urgent CT and MRI in the case? 2. If the authors could provide normal MRI imaging after recovery from the contrast induced neurotoxicity, it would be better. 3. A typographical error: "...intervantionalists..." in the abstract.

## COMMENTS TO AUTHORS

This case report does not add any more than what is already evident in the published literature.
