COMMENTS TO AUTHORS

This review addresses an important topic within the dengue field. Thus, it will merit publication. However, I feel the manuscript must be improved in the English language and organization. Please see the attached document with suggestions. Table 2 will be more informative if information about adults is included for comparison.

COMMENTS TO AUTHORS

The manuscript is a fair review of the hepatic complications of dengue fever. The overall readability of the paper is impaired by the use of some unusual terminology which in some instances is unscientific. I am sure that this is a problem related to English not being the 1st language of the authors. I have corrected some, but not all, of the mistakes I found using track changes in the attached Word document. There were some acronyms that were not spelt out and some of the reference formatting needed to be fixed. A further revision of the paper by someone who is proficient in English scientific writing would make the manuscript more readable. In terms of the synthesis of the literature cited and the overall scientific merit of the paper the authors have done a commendable job.
