COMMENTS TO AUTHORS

This is an interesting case report. But the conclusion should be re-written to support the results. 1. Compare a case report of gingival unit and FGG cannot make a conclusion "one is better than the other", especially the pattern/size of rootexposure, size of wound bed and the thickness of tissue are different. 2. The author just can say gingival unit method can be successfully used for treatment of 3. Radiographic pictures of these affected teeth should be shown.

COMMENTS TO AUTHORS

Miller Class III gingival recession is an important problem in periodontal plastic surgery. Traditional surgical procedures such as coronally advancing flap with connective tissue graft of free gingival grafting are unfortunately insufficient for root coverage in class III cases. Gingival unit transfer may be an alternative procedure for these cases and this case report may form basis for future surgical techniques to obtain predictable defect coverage.
