COMMENTS TO AUTHORS

The authors present a case report of a patient who develops acute esophageal necrosis as a complication of diabetic ketoacidosis. The reviewer has minor grammar suggestions: 1. Case report, paragraph 1, line 5: These symptoms started... 2. Case report, paragraph 1, line 7: He had undergone previous excision of a superficial melanoma... 3. Case report, paragraph 6, line 4 = and an endoscopic esophageal dilation was successfully performed. Please define whether biopsies were undertaken, either at baseline or with subsequent endoscopies. If so, what did they show? If not done, why not? If they had been done, what would histology have shown?

COMMENTS TO AUTHORS

Interesting case report of a rare esophageal disorder. It is well descrivere, but the english language must be review in many periods. As an example, in the conclusions: Interestingly,,(and most importantly,) our case report also shows that AEN may occur in a middle-aged patient with DKA without (multiple) co-morbidities and (who does not have any) clinical signs of hematemesis, coffee ground emesis or melena.

COMMENTS TO AUTHORS

Dear Authors, This was an interesting case report of a rare disorder. This disease is underrecognized and agree that there needs to be increased attention to the presence of this disorder. Comments #1 Not clear from the text why the initial EGD was performed #2 Can you provide more details of the EGDs, extent of superficial necrosis in length, location of GEJ, any Barretts or other concomitant lesions? #3 Can you provide some details on the dilation? Dilated by which means? to what size? And any further symptomatic follow-up following dilation? #4 Probably don't need to include as much detail on the normal lab and imaging studies in the case description
