### COMMENTS TO AUTHORS

The article is well written and the topic captures your attention; I believe that shortening the text can improve the overall appearance. A few points would have better defined: 1 Case presentation, seventh line: Authors should clarify whether a frozen section was done. 2 Case presentation, ninth line: Authors should precisely define the final diagnosis. 3 Case presentation, last line: on TC, the mass seems to compress the bronchus for the middle lobe; Authors should convincingly motivate the decision not to proceed with the mass removal.

### COMMENTS TO AUTHORS

**REVIEW** The authors present a case of pulmonary inflammatory pseudotumor (IPT) and perform a review of this pathology. The review is well structured and current enough. The article provides information that is useful for application to clinical practice. HOWEVER, in the clinical case presented, in my opinion, it is arguably the conservative actuación followed. While it may be debatable, in the present case, resection of the lesion, in the case of a woman 43 years and with acceptable pulmonary function, I think it is the best choice. I think the article is of interest and has clinical utility.
