### SPECIFIC COMMENTS TO AUTHORS

First of all, I would like to commend the authors for presenting a nicely written, concise and well-structured manuscript. The authors present an interesting case of acetaminophen induced pancreatitis and literature review. Clarify that patient used paracetamol only (not a combined drug containing other medications). There is a need

for a systematic review of the data available in the as it was not previously done. I would suggest, to include a paragraph on the combined codein/paracetamol medications induced acute pancreatitis, because there are cases of paracetamol/codein and codein alone induced acute pancreatitis described in the literature. Overall, little criticism could be expressed regarding this paper. English language requires minor polishing.

### SPECIFIC COMMENTS TO AUTHORS

An interesting and well written case report. Yet this has been published 11 times before. I would suggest the following: 1. Demonstrate how different is this case report from the previous reports. 2. Enter the dose of acetaminophen used in the previous case reports 3. Explain why MRI cholangiopancreatography is better and more sensitive

than the modalities in the diagnosis of acute pancreatitis 4. Omit the second line in the discussion or from the introduction since it is a repetition 5. Explain why women are particularly susceptible to toxicity at a lower dose 6. Explain whether the frequency of acetaminophen has anything to do with causing AP 7. Add a table of the common convention causes of AP 8. Page 6, line 11 add 's' to categories 9. Page 6, line 11 explain the basis of the classification
