SPECIFIC COMMENTS TO AUTHORS

The authors reported a case of entrapment of temporal horn secondary to postoperative gamma-knife radiosurgery (GKS) in intraventricular meningioma. I have comments in detail as follows: 1. The image in Fig 1.c already showed hydrocephalus and residual

piece of tumor before GKS. Except for neuroimaging findings before and after the first operation, before and after GKS, and before and after the second operation, the authors should supplement the pathological results of the two operations as well to testify the case secondary to tumor edema and increase due to postoperative GKS rather than a coincidence of disease progress after GKS following surgical resection. 2. The course of GKS therapy or the total amount of radiation exposure was unclear. Please clarify it. 3. It is suggested that the time axis should be used to better present the course of treatment.

SPECIFIC COMMENTS TO AUTHORS

This manuscript is interesting and shows a complication of radiosurgery which should be considered in similar situations; however, various points must be addressed: 1. In the title the line "a case report and review of the literature" is redundant and this report

is not a comprehensive review of the literature, I think it could be deleted. 2. The word “impeded” on P4,p1,L2 is odd, a more descriptive word could be used (obstruction, blockage, etc.?) 3. English editing is necessary.
