SPECIFIC COMMENTS TO AUTHORS

The manuscript is well-written and interesting, thoroughly presenting an interesting case and providing comprehensive background on a rare complication of secondary hyperparathyroidism - Sagliker syndrome. However, several issues concerning the case should be clarified: 1) the authors state that the etiology of chronic kidney disease is unknown (as it is often the case), only information about the duration of peritoneal dialysis is provided, however there is no information about the duration of the kidney disease itself 2) a single preoperative parathyroid hormone (PTH) value is provided (2815.07 pg/ml); in order to timely demonstrate the development of the disease, please state several previous (serial) PTH values 3) only generic names of the drugs should be used in the manuscript “.....took calcium acetate, vitamin D, erythropoietin (EPO) and Adalat.....” 4) the authors state that the patient was regularly treated “...She regularly took calcium acetate, vitamin D, erythropoietin (EPO)....” if that was the case, please comment her extremely low hemoglobin value of 48 g/L (normal range: 120-160 g/L), 5) please clarify the following sentence “A neck CT scan showed a benign nodule on the left side of the thyroid with bilateral soft tissue signals behind the bilateral thyroid” 6) please comment and explain the increasing postoperative PTH value of 131.01 pg/ml (4 months after the discharge) 8) referring to the previous comment was any assessment undertaken in order to investigate a rise in PTH value(s)? 7) please modify the references according to the recommendations of the journal
