SPECIFIC COMMENTS TO AUTHORS

The authors describe a patient with scrotal and penile avulsion treated with VAC, artificial dermis and STSG. The authors state that this type of injury is extremely rare and conclude that this combination can successfully treat such patients. A thorough literature review confirms the above statements. Astonishingly, I could not find any publication, describing this combination for such injuries, although artificial dermis, skin grafting and VAC therapy are well-established reconstructive modalities. The manuscript is well-written and delivers a clear message. The patient received the best possible therapy. For all these reasons I consider the manuscript worth publishing. I congratulate the authors on the good work, especially on the explanation why they applied this combination (lines 177-179), leaving no space for comments that skin graft alone could be adequate. These are basics, that, unfortunately, most physicians practicing plastic surgery have not understood. Some minor revisions: - Too much subheadings in the case presentation section. They could be omitted. However, this depends on the journal's policy. - Line 179: Rewrite the sentence to avoid the term bad. The two-staged procedure to avoid complications is a „must“. - The literature can be enriched to include papers presenting the use of the combination for penile reconstruction in general (eg. Pieptu 2014 etc). After all it makes no difference whether the defect is a result of avulsion or burns or tumor excision, since no free flaps are implemented. - Postoperative figures after stich removal will be helpful.
