## **SPECIFIC COMMENTS TO AUTHORS**

This is an interesting manuscript about the relevant diagnosis and outcomes in patients with leiomyosarcoma. The patients were divided into the uterine leiomyosarcoma group and non-uterine leiomyosarcoma group based on tumor origin. The data demonstrated that serum tumor makers have limited ability in leiomyosarcoma diagnosis. In addition, ultrasonography has limited ability in distinguishing between benign and malignant foci. As for outcomes, there were no significant differences between uterine leiomyosarcoma group and non-uterine leiomyosarcoma group. However, FIGO stage was a significant predictor of progression-free survival. This manuscript is nicely structured and well written. I have no question about this manuscript.
