SPECIFIC COMMENTS TO AUTHORS

This study demonstrated the anal uptake of FDG and therapeutic intervention retrospectively. Although this is an important analysis on how to address the incidental anal uptake of FDG, I think there are some points that need to be explained more clearly.

Comment 1 The comparison of the patients who were offered treatment and those who were not is the main point of this article. Therefore, it is important to describe more clearly the rationale for and the definition of offering treatment. Was the decision to offer treatment decided only on the diagnosis and its severity? Are there any considerations about the patient's preference or prognosis that need to be taken into account?

Comment 2 The final diagnoses of the examined patients should be listed and compared between the patients who were offered treatment and those who were not. I think it is more important to detect neoplastic lesions than benign hemorrhoids.

Comment 3 The patients who were offered treatment appear to have been symptomatic more frequently than the patients who were not offered treatment. I think it is important to detect patients who should be offered treatment among asymptomatic patients. Among the 29 asymptomatic patients, were there any differences in FDG up-take between the patients who were offered treatment and those who were not? Please consider multivariate analysis, including FDG uptake and symptoms as factors affecting the offering of treatment.
