## **SPECIFIC COMMENTS TO AUTHORS**

The severity of stress urinary incontinence varies; patients with mild cases only have very little urine overflow, which leads to a small impact on daily life, but some severe urinary incontinence cases lead to more urine overflow, which seriously affects patients' daily life. At present, there are many methods available for treating stress incontinence, such as life feedback training and pelvic floor muscle function exercises. However, these kinds of treatment are time-consuming and have highly variable curative effects. Tension-free mid-spadias suspension is a common surgical treatment, but some scholars have pointed out that there are some potential risks of the surgical treatment, such as puncture site injuries, hematomas, and long-lasting inguinal area pain; in addition, patients generally develop severe pain after the operation, and the clinical applications are also limited. There are relatively few clinical reports on this treatment. In this study, the clinical value of the needle-free sling was further analyzed. The design of the study is good, aims are clear. Inclusion and exclusion criteria are reasonable and clear. Overall, the manuscript is well written. Minor comments: 1. A background is missing in the abstract. 2. Tables are good, but requires editing. 3. References are updated. However, the style of the references should be edited and updated.

#### **SPECIFIC COMMENTS TO AUTHORS**

Very interesting study. Only a minor language editing is required. Thank you very much.
