This is a nice, concise review of myelolipomata especially those found in the liver. There is a small risk of malignancy so biopsy and careful observation is the first line of therapy recommended. However they may be come very large tumors so surgical resection is often necessary.

This is a case report of very rare tumor. The rarity of this tumor might be worth for publish in this journal, however, there are some points which should be revised. 1. The author reported that tumor is located in right liver, however, tumor located in S4, left side of the GB in the picture. 2. This is a very rare tumor report, therefore, the author should describe imaging pattern in dynamic CT in detail. 3. Types of the surgical resection should be described. Laparoscopic partial resection of S4? 4. There is a discrepancy between CT findings and angiography. The authors mentioned that the tumor is hypervascular, but CT seems not so hyper vascular. Furthermore, the tumor is smooth round shape in CT and US, however, it is irregular shape in angiography. It lacks consistency. 5. Discussion should be done for the indication of the surgical resection. This is a young woman and tumor is not malignant, so, biopsy and follow-up is the best choice for her. 6. In conclusion, criteria must be deleted. This criteria can distinguish MH and lipoma?, is it true the tumor only located in right lobe? They are non-specific informations. 7. In table, left/right liver lobe is not correct word. Left liver or left hemi-liver is correct. See the nomenclature published by Strasberg et al. 2005 JHBPS (PMID16258801)
