My suggestions to the authors are following; 1-They should provide whole blood count and blood electrolyte of hte patients before and after the treatments, as one finding of rhabdomyolysis is elevated potassium level in circulating blood. 2-They may expand discussion section with especially rhabdomyolysis literature (for instance Rhabdomyolysis, compartment syndrome and thermal injury.Coban YK.World J Crit Care Med. 2014 Feb 4;3(1):1-7.) 3-If the extract of the subject is known, what pathophysiology might be in this clinical scenario?
