#### **SPECIFIC COMMENTS TO AUTHORS**

This manuscript is a case series of cerebral infarct secondary traumatic internal carotid artery dissection (TICAD). Its characteristics and treatment are not enough discussed as previously reported cases are limited. The authors hypothesized the correlation between severity of cerebral infarct and openness of communicating arteries. While this article will likely be of interest to clinicians in the field, the following issues require clarification:

1. The authors should describe how collect eligible papers in detail. 2. Please provide Table 1. 3. Please explain a neurological function examination. 4. In Figures, please add an arrow to indicate what the authors attempted to point out. 5. The authors should present and explain Figures in the Results section. 6. The Conclusion is slightly redundant and it should be summarized. 7. The authors stated that early and efficient diagnosis was essential for initiating appropriate treatment and improving outcome. I think traumatic injuries near the internal carotid artery is an important clinical point to suggest TICAD, which may contributes early diagnosis. The authors should comment this point. I hope these comments will be helpful for improving this manuscript.

## RE-REVIEW REPORT OF REVISED MANUSCRIPT

**Name of journal:** World Journal of Clinical Cases

**Manuscript NO:** 56276

**Title:** Cerebral infarct secondary to traumatic internal carotid artery dissection
