This case report is valuable, because endoscopist see many sub mucosal lesion in stomach specially in proximal part , and this lesion as a rare SML considering is interesting diagnosis. Anyway increase of marker as CA72-4 is not specific for these lesions and seem not important for different of them. Thanks Dr. Fatemi

Dear authors, you have described interesting and rare case, and you did it in a clear and concise manner. Title, abstract and key words are adequate to the topic. Methodology and patients diagnostic and treatment protocol is clearly described. Discussion is thorough and sharp, and the literature is up to date (if we take into consideration that you have analysed old published cases). My complaint regards the fact that you had used results obtained by radiologists and pathologist (without whom there would be no definite diagnosis!) but none of them is coauthor of this paper. For some further on manuscripts, this will be one of the major remarks.

This is a case report of a bronchogenic cyst in the gastric wall. Since this is very rare, it should be published to make the medical community aware of such lesions. English is good and images of histology and radiology are good.
