SPECIFIC COMMENTS TO AUTHORS

In the process of traditional treatment, patients are prone to exhibit negative psychological reactions such as anger, anxiety, and depression, including anxiety about cancer, fear of death, pain of loss of dignity, and thoughts of suicide. At present, various diagnostic and treatment methods for cancer, including surgical treatment, radiotherapy, chemotherapy, and targeted drug treatment, subject the patient to considerable trauma. Individuals with different personality traits face risks induced by different diseases. Negative emotions hinder the treatment and recovery of cancer patients and seriously affect their quality of life. This study explored the effects of cognitive behavioral therapy on the personality characteristics of cancer patients. The design of the study is good. Methods and results are interesting. After a minor language editing, it can be accepted for publication.
