#### **SPECIFIC COMMENTS TO AUTHORS**

Most diffuse large B-cell lymphoma patients can achieve a complete response after first-line treatment. And finding effective biomarkers to predict the prognosis and recurrence of diffuse large B-cell lymphoma among patients is still needed. Studies show that the ratio of lymphocytes to monocytes can best reflect the host immune state, thus can be an effective prognostic marker in diffuse large B-cell lymphoma patients. The systemic immune inflammation index is a comprehensive inflammatory marker based on peripheral blood neutrophils, platelets and lymphocytes count, which can be used to predict the clinical prognosis of non-small cell lung cancer, gastric cancer, pancreatic cancer and many other solid tumors. In this study, the authors explored and discussed the association between SII, LMR, LMR/LDH, and prognosis of diffuse large B-cell lymphoma patients. The study is over all very interesting. The manuscript is very well written. Some minor comments: 1. A minor language polishing should be revised. 2. The images are too small, please check and update. 3. The references should edited and updated.

#### **SPECIFIC COMMENTS TO AUTHORS**

This is an interesting study about the association between systemic immune inflammation index, ratio of lymphocytes to monocytes, ratio of LMR to LDH and prognosis of patients with diffuse large B-cell lymphoma. The study is well designed. The results are discussed with updated references. Before publication, a minor editing is required.
