## **SPECIFIC COMMENTS TO AUTHORS**

First, this article is about a case of multiple mononeuropathy with systemic vasculitis. The author observed an interesting phenomenon. The author recorded the experimental records of patients in hospital and 4 months after discharge. Secondly, this article gives some enlightenment to clinical staff, that is to pay attention to the patients' vasculitis and its complications. Third, the article has good logic, but there are some problems of lack of rigor. 1. the increase in the concentration of leukocyte and C-reactive protein is mentioned in line 96. Please give the standard value. 2. immunosuppressive therapy is mentioned in lines 120, 137 and 143. It is important to ask for the specific drugs and dosage. 3. The treatment of antibiotics is mentioned in line 181. Please ask the dosage of antibiotics used by patients. 4. in line 179, the author wrote "historical evidence of vasculitis was present in only self of cases", while Quotation No. 14 concluded that "GI release was found in 6.5% among 216 patients with GPA or MPA". The value is obviously unreasonable. Please explain this problem. GI: Involvement of the gastrointestinal , GPA; granulomatosis with polyangiitis, MPA: microscopic polyangiitis. 5. in lines 189-191, the conclusion should be brief and the first sentence of the conclusion should be deleted. 6. lines 282, 285. The chart in this paper should meet the basic logic of statistics, namely, three line table. Although Table 1 is composed of two tables, it is suggested to divide Table 1 into two tables to increase reading ability. Table 2 is difficult to read and easy to mislead Reader 1. It is strongly recommended that table 2 be divided into two tables. 7.285 what is EMG, please let me know the full name before abbreviation.
