COMMENTS TO AUTHORS

This is a well written paper aimed to review indications, techniques, and results of endoscopic papillectomy. The abstract well structured and gives an adequate overview of the entire paper. The results and conclusions are credible to clinically oriented physicians. However, minor revisions are needed: As post-interventional pancreatitis is one major complication that might occur after papillectomy, I miss the discussion about rectal administration of indomethacin or diclofenac prior/after the procedure. The author should therefore also refer to the study of Elmunzer et al. (N Engl J Med. 2012 Apr 12;366(15):1414-22. doi: 10.1056/NEJMoa1111103) in which a reduction of post-ERCP pancreatitis could be observed after rectal application of indomethacin. This might also prevent post papillectomy pancreatitis.
