COMMENTS TO AUTHORS

This paper revealed Cerebral and splenic infarctions after injection of N-butyl-2-cyanoacrylate in esophageal variceal bleeding. It is well known that injection of N-butyl-2-cyanoacrylate is associated with a variety of complications including systemic embolization. Various methods (for example, attach the balloon on the endoscopy) are tried in order to prevent systematic embolization. We did not find systematic embolization induced by EIS, recently. So, this case report is not critically important and interesting.

COMMENTS TO AUTHORS

This paper is good to the young doctors especially who just start to do endoscopic treatment for esophageal varices. For more information to prompt the evidence of spleen infarction, you'd better to give us the CT scan before treatment. As you know, enhanced CT scanning is a routine work to us before endoscopic treatment for varices.
