COMMENTS TO AUTHORS

The draft is well written and fluent. However, the overall management of the two cases is debatable.

COMMENTS TO AUTHORS

Interesting paper, but at least several points should be clarified. First of all how many surgical treatments for hepatolithiasis have been performed in the author's facility? Two cases are small number but in case of large number of surgery for hepatolithiasis were performed, what is the specific problem in these 2 cases compared with the other operated cases without complication of BCS. Iatrogenic BCS should be surveyed and discussed using PubMed etc. Table 1 is too short to understand the patient condition. More data including blood count, coagulation, etc. should be added.

COMMENTS TO AUTHORS

The manuscript entitled with "Iatrogenic Acute Budd-Chiari Syndrome Following Hepatectomy for Hepatolithiasis: two case reports" presents cause of acute out flow obstruction after hepatectomy and management of the complications with good outcome. While I enjoyed the manuscript, the following comments emerged: 1. The manuscript is too long for case reports and should be shortened especially at section of case presentation. 2. The English should be edited. 3. more specify more on how to avoid the surgical complication in case with repeated cholangitis due to hepatolithiasis 4. The outflow obstruction usually happens after hepatectomy immediately, please describe why it became worse gradually.

COMMENTS TO AUTHORS

I think the iatrogenic acute Budd-Chiari syndrome (BCS) was caused by operation of hepatectomy for hepatolithiasis. It is the complication of hepatectomy for hepatolithiasis. The complication can be avoided by the evaluation preoperation. When necessary, methods may be performed to prevent iatrogenic acute Budd-Chiari syndrome (BCS) in hepatectomy for hepatolithiasis. I think the manuscript should be rejected.
