COMMENTS TO AUTHORS

The authors presented an interesting case report. Clinicians should consider this pathological association in cases of mesenteric venous thrombosis.

[] Grade E (Poor)		[] No records	[] Major revision

COMMENTS TO AUTHORS

This case report is well written and describe a relatively rare combination of mesenteric vein thrombosis and heterozygosity for two known prothrombotic mutations. Apart from one minor detail the case story can be recommended for publication. See below for details. Presentation of the case is short and concise. The figure has sufficient resolution and the annotation enables non-radiologists to see the pathology. P 3 1st paragraph: "Also the age of the first episode..." Suggest change to "Also the age at the first episode..." as the age refers to the patient age, not the age of the episode?

COMMENTS TO AUTHORS

This is an interesting case report. It is well written and documented. The relative effect of the use of oral contraceptives compared to the Factor V Leiden and prothombin gene are not clear.
