COMMENTS TO AUTHORS

This is a review paper on possible clinical significance of bone marrow stromal cells in the field of hepatobiliary surgery. The authors relatively well summarized the reported data. However, there seem to be several major concerns in this manuscript. 1. Extensive edition of English language is needed by native speaker. 2. Structure of this review is not well organized. Logical connections among the subheadings are unclear and descriptions read just enumerated evidences. Authors should summarize the reported data in more efficient way and should clarify how much we know now and how much we can expect its therapeutic effect.

COMMENTS TO AUTHORS

The current article entitled " Progress of bone-marrow stromal cells (BMSCs) in Liver Regeneration and Metastasis after Hepatectomy " by Huang HL et al. reviewed the BMSCs and their possible applications in liver regeneration and metastasis after hepatectomy. The topic is of interest both for basic research and for potential future applications of BMSCs in terms of liver disease (HCC...). This article is written in an intelligible fashion, however there are still several typographical and grammatical errors which should be revised before it can be considered for publication.

COMMENTS TO AUTHORS

I have read with interest the manuscript entitled "Progress of BMSCs in Liver Regeneration and Metastasis after Hepatectomy". It is a very interesting topic for the readers of WJG. However, there are two minor concerns in the paper. 1. The literature review is poor, and some assertions and claims should be supported by references. 2. As presented, the writing is not acceptable for the journal. It should be checked again by a native English speaker before it can be published.
