COMMENTS TO AUTHORS

The manuscript by Chun-Lai Dai et al explored the characteristics of multi-slice CT manifestations of hepatic epithelioid angiomyolipoma. The paper is very well written. Some minor comments: 1. Some abbreviation should be explained when it first appear in the text. 2. It seems there are some symbols are in Chinese type? 3. Some minor Spelling error should be corrected.

COMMENTS TO AUTHORS

This is an interesting manuscript about MSCT in the manifestations of hepatic epithelioid angiomyolipoma. Hepatic epithelioid angiomyolipoma is a kind of very rare mesenchymal tumors, which is a special type of lipomyoma, and it mainly consisted of epithelioid cells. The clinical manifestations have no specificity, and it is easily to be confused with many kinds of tumors, so the misdiagnostic rate is very high. MSCT is an important method for preoperative diagnosis. In this manuscript, the authors explores and analyzes CT manifestations of five patients with HEA who were diagnosed definitely by pathological examination and immunohistochemistry, and provide reference for improving accurate rate of diagnosis. The manuscript is very well written, only some minor spelling mistakes should be corrected.
