COMMENTS TO AUTHORS

This is a well-prepared case report about *Helicobacter heilmannii sensu stricto* (as a zoonotic bacterium previously known as *Gastrospirillum hominis*) which is responsible from at least 1% of human peptic disease and possibly related with gastric malignancies such as mucosa associated lymphoid tissue (MALT) lymphoma and gastric adenocarcinoma. Is there any explanation for negative urea breath test, despite to knowledge that one of false positivity of UBT is *H. heilmannii*?

COMMENTS TO AUTHORS

Dear Authors, This is a well documented proof of a H.Heilmannii s.s. infection in a human gastric mucosa. I have two comments; 1. The introduction section is a bit long for a case report and this section can be shortened, 2. Too many references are given, the number of the references can be reduced.
