COMMENTS TO AUTHORS

Camera and colleagues report on a rare case which I enjoyed reading. The case is well documented by figures. I have some questions: 1. Why didn't the MR reveal the foreign body? 2. Did the patient receive a colonoscopy if an inflammatory bowel disease was suspected? 3. Why do the authors discuss a perforation in the transverse colon if they performed a right hemicolectomy? 4. Are there any pictures of the surgical situs after laparotomy? It is evident that the authors are no native English speakers. The MS has to improve in language and style prior to publication.

COMMENTS TO AUTHORS

This is a very interesting case report. I only have some minor comments: 1. page 3, Under the section of Case Presentation, 2nd paragraph, "an hysterectomy" is changed to "a hysterectomy". 2. Page 7, move the last sentence "To the best of our knowledge such a case has never been reported in the literature" to the beginning of Discussion. 3. Suggest highlighting the diagnostic value of multidetector CT in the diagnostic evaluation of retained surgical sponge or other substances.
