COMMENTS TO AUTHORS

Comments for WJG No. 7077 Because of the shortage of donated organs, donors with previous cancer and other co-morbidities are being considered for donation. Thus, allograft recipients are at greater risk for cancer, mainly malignancies either virus-associated or related to pre-existent factors. This review points to the need to improve cancer surveillance after organ transplantation. And it points out the prevention and management of donor transmitted and de novo cancer after liver transplantation. The English writing of this paper is good. So I think this paper can be published in WJG.

COMMENTS TO AUTHORS

The manuscript gives an overall perspective regarding the development of cancers in liver recipients, especially donor transmitted cancer and de novo cancer. The authors elucidate donor transmitted cancer (DTC) after liver transplantation results from donors with cerebral haemorrhage, a history of cancer and non-cancer donors. They also describe de novo cancer after liver transplantation and the risk factors for post liver transplant cancer. Prevention and management of cancer after liver transplantation are also reviewed in this manuscript. It is useful for getting a legible understanding of cancers post liver transplantation. And it provides important advises to avoid risk behavior and monitored appropriately. However, there are still some issues as follows: 1. Some writing issues: "The risks of donor-transmitted cancer is..." (page 2, line 3rd), "a EBV..." (page 15, line 16th). 2. There is still minor revision about the references, such as ref. 1, which does not mention the 1-year and 5-year survival rates for adults undergoing primary liver transplant for chronic liver disease.
