COMMENTS TO AUTHORS

I reviewed with great interest this relatively rare but dramatic case report, which, I believe, should be adequate to be published in WJG. I have only two minor suggestions for improving the readability of this article as seen below. 1) The full spelling of "HELLP syndrome" should be given once more when it first appears in the body text in case some readers skip viewing the prior parts of the article. 2) The legends for the two figures should be detailed. For instance, Fig 1 of coronal MR image was acquired by what sequence and the subcapsular liver hematoma should be indicated by arrow(s).

COMMENTS TO AUTHORS

KOENEMAN et al. describes for the first time a long-term hepatic sequel of a subcapsular liver hematoma complicating HELLP syndrome. They suggest that laparoscopy is key in confirming the diagnosis of perihepatic adhesions, which also enables immediate adhesiolysis as an effective therapeutic modality. Besides this referee may suggest that others biochemical resource may offer indicative as diagnosis also. The authors must provide information on ethics committee approval.
