COMMENTS TO AUTHORS

PPFM is used to combat against HP associated with ulcer and risk factor for gastric cancer. Its used combined with standard care, increases the chances of recovery and reduce adverse effects like previously reported by the same authors in a meta-analysis (Eur J Gastro and Hepathol, 2009). Herein authors added some indications regarding more specifically some components of the milk, however this novel point is not stressed enough in the present paper. I suggest to more added comments to this point in the abstract, introduction and discussion to highlight the novel informations reported in this meta-analysis with respect to the previous one.

COMMENTS TO AUTHORS

This article is a well-designed and well-written review concerning effect of milk and milk proteins on Helicobacter Pylori eradication. This natural complementary therapy may decrease therapeutic and clinical problems involved in conventional pharmacotherapy of Helicobacter Pylori infection. This review will be interesting for gastroenterologists and for all clinicians who encounter the questions of Helicobacter Pylori management in their patients. I therefore recommend this paper for publication in World Journal of Gastroenterology.

COMMENTS TO AUTHORS

The information contained in this paper is valuable and is the result of an exhaustive study of the literature for which the authors are to be congratulated. In its present form, however, it would be more suitable as an academic dissertation or thesis than as a paper in a journal. The evidence is presented and analysed in the form of long Tables which would not be reproducible in the context of a journal. The conclusions are of interest and if the authors could summarise them in a short report I think that then they would be suitable for consideration for publication.

COMMENTS TO AUTHORS

I think that authors check 68 documents well. However, it is distributed between 29 in a table when I read an article at A4 size. It is hard to read a table, and there is much quantity of the table, too. There are few commentaries of the text by just that much. I think that the author needs improvement as appearance of the articles.

COMMENTS TO AUTHORS

The manuscript (4452) entitled: "EFFICACY OF FERMENTED MILK AND WHEY PROTEINS IN HELICOBACTER PYLORI ERADICATION, A REVIEW" is the result of thorough analysis and grading of the existing reports in the field. However, the text needs to be simplified in order to benefit a broader range of readers. It is, therefore, requested that long complicated sentences be split into short simple sentences, clearly explaining the information provided in the tables. The conclusion should summarize the findings according to the grading and rating of the reports.
