COMMENTS TO AUTHORS

This short report describes an in vivo study evaluating haematological consequences of infection with Helicobacter pylori. 1. The underlying concept that infection in gerbils will represent human infection in regards these outcomes of concern may be oversimplified. 2. Did the animals have persisting infection at the three time points? did the animals all have gastritis? or other manifestations of infection. Rapid clearance of infection would not be expected to lead to the same consequences as persistant and/or complicated infection 3. Was the diet and the amount of intake the same for all animals? 4. There are numerous errors of spelling and English grammar that require attention

COMMENTS TO AUTHORS

The message of the article is important and needs to be published. I, however, feel that the following steps need to be taken to make the manuscript worthy of publications. 1. Extensive language editing and spelling check is required. 2. Facts of error such as those in para two of page three where the numbers do not add up need to be clarified. 3. The manuscript needs to be shortened to only focus on the main issue
